

ML for Bank Claim Management Prediction

Mayara Cordeiro

Project overview

Problem Definition

Data Preprocessing

Data cleaning Nan values Encode categorical values **Prepare Data for ML**

Vector Assemble, split data (test, train)

Apply models

Logistic Regression Decision Tree Classifier, Random Forest Classifier, Gradient-boosted Tree Classifier **Evaluate Models**

Binary Classification Evaluator; Multi Classification Evaluator

Run the project

"What is the best ML algorithm to improve a claim management process in a bank?"

The data

- Null values
- Alphabetical

ID /	target	▲ v1	▲ v2	▲ v3	▲ v4	v5 🔺	v6 🔺	v7 🔺	v8	v9 🔺	v10 🔺	v11 🔺	v12 🔺	v13	v14

Data Preprocessing

- CSV data
- Convert data types
- Replace nan values
- ☐ Encode categorical to numerical labels
- Result: New csv data

Prepare data for ML

- Vector Assembler
- ☐ Split data (train, test) randomSplit([0.7, 0.3])

Apply models

- Logistic Regression
- Decision Tree Classifier
- Random Forest Classifier
- ☐ Gradient Boost Classifier

Evaluation

ROC Accuracy

Logistic Regression: 0.72 Logistic Regression: 0.767

Decision Tree Classifier: 0.63 Decision Tree Classifier: 0.776

Random Forest Classifier: 0.71 Random Forest Classifier: 0.760

Gradient Boosting Classifier: 0.74 Gradient Boosting Classifier: 0.779

prediction target 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1.0 1.0 0 0 | 1.0 0.0

Conclusion

The ML algorithms allows the model to predict eligible process to be solved in priority. Improving the bank services and contribute to deliver a quality service for its clients, by decreasing the processing time.

Accuracy results are closer between the methods, gradient boosting tree presented better results in ROC and accuracy.

Improve the models performance: analyzing better the categorical features and selecting less but important columns to improve the model.
